

NARROGIN ARBORETUM

The Narrogin arboretum was one of more than 50 demonstration plantings established by the then Forests Department, throughout the wheatbelt, in the 1950's and 1960's. The arboreta were developed to evaluate a range of local, regional, Australian and overseas species that were thought to have promise for planting in the wheatbelt and goldfields, with a focus on species for quality timber, dust control and for windbreaks

The Narrogin arboretum, smaller than most, was added to over several years as new species became available, with the last trees being planted in 1969. Some species have prospered. Others haven't.

Since the mid 1980's the arboretum became neglected and overgrown until the Friends of Foxes Lair took on the project in 2002. Regrowth and rubbish were removed, with the remaining trees being pruned and pegged. New species are being added including sandalwood trees that are on the south side of the Granite Car park.

The arboretum was originally laid out as one species per row; 6 seedlings on a 5 x 5m spacing. Over time, failed species were replaced (though not always with the same species) and at some stage; a buffer was planted on three sides.

The best starting point is from the granite carpark. The tree numbers start at eastern end, with the pegs being located on the southern side of the tree. All the surviving trees have been numbered; with other previous planting sites being shown with a small wooden marker, which help define the alignment of the rows.
